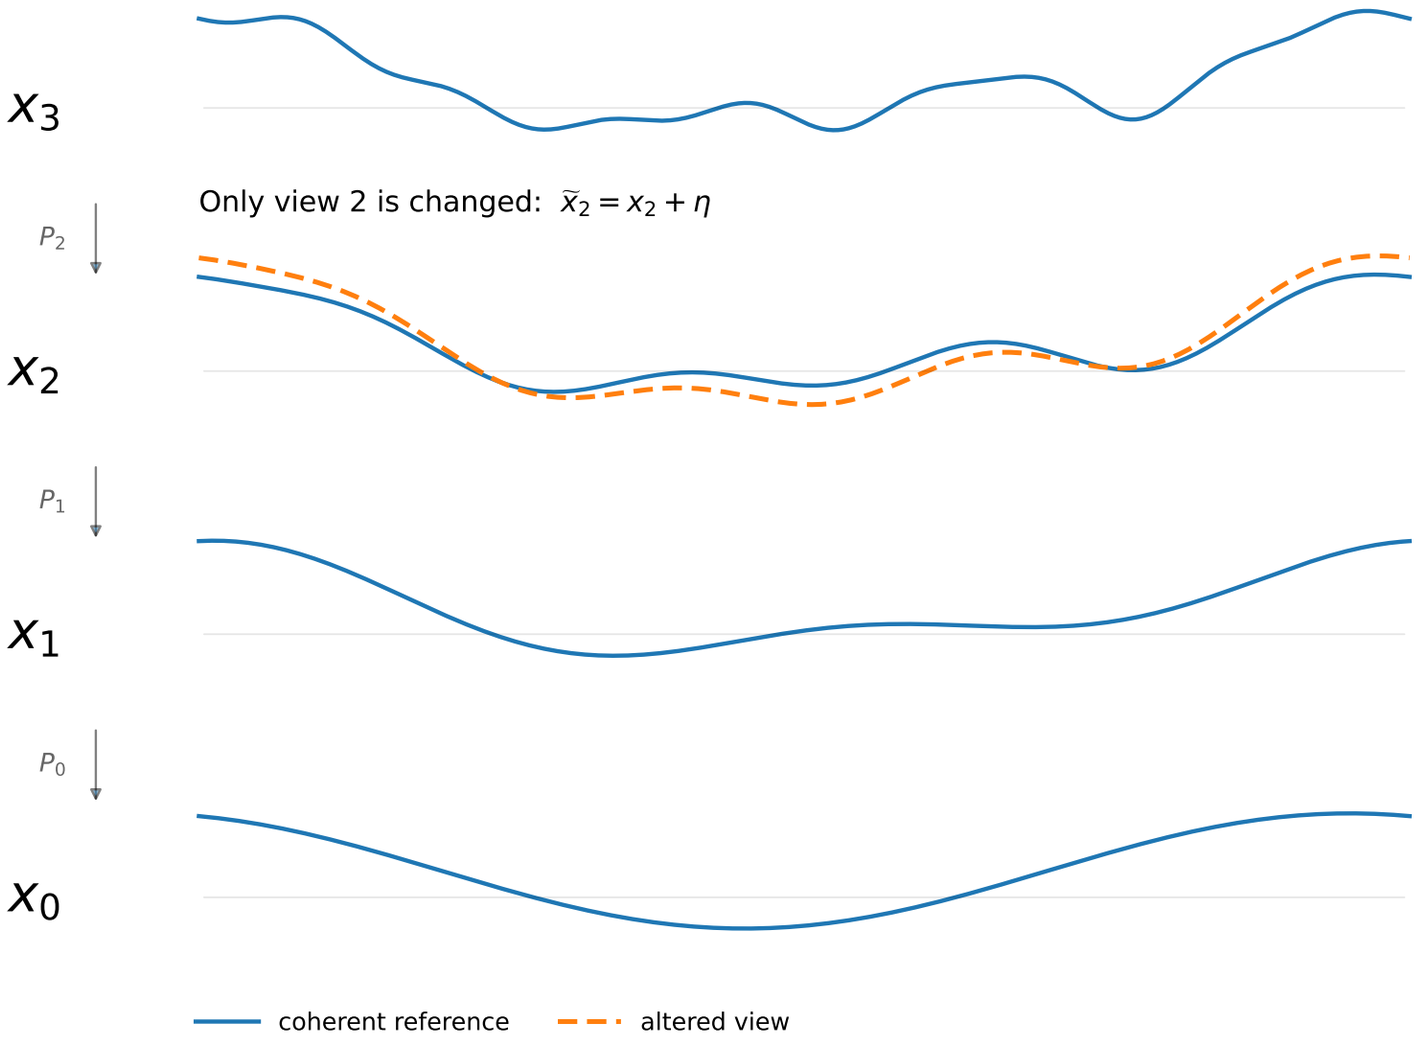
Detail is not inconsistency

Change one view. The compatibility differential records exactly where agreement fails.

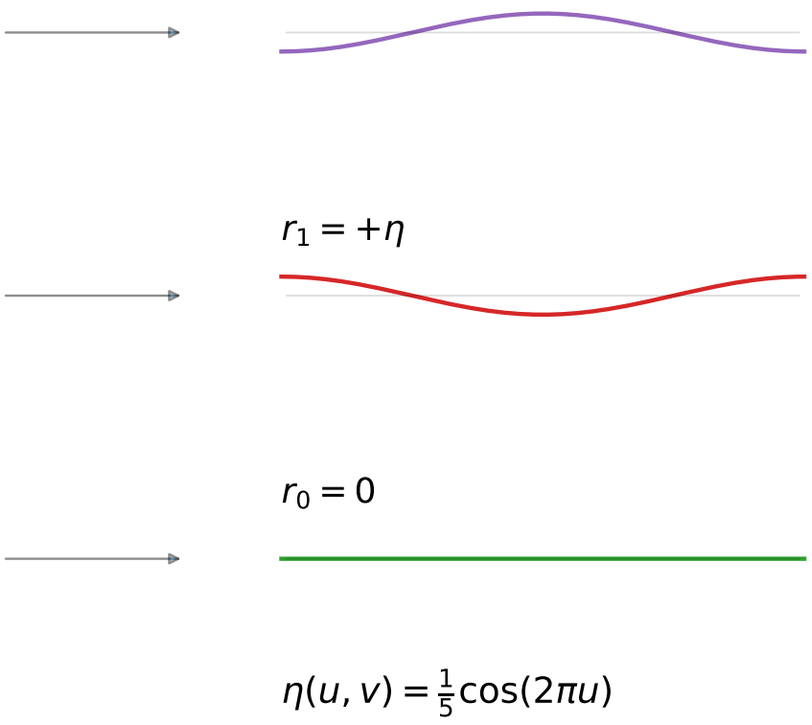
VIEWS OF THE SAME FAMILY

Signal slice at $v = 3/16$



TYPED DEFECTS

$r_n = P_n \widetilde{x}_{n+1} - \widetilde{x}_n$



RETAINED DETAIL

$$d_n = x_{n+1} - J_n x_n \in \ker P_n$$

May be nonzero even when the family is perfectly coherent.

COMPATIBILITY DEFECT

$$\delta\widetilde{x} = (0, \eta, -\eta) \neq 0$$

Subtracting η from view 2 repairs this family exactly.

This defect is repairable. A nonzero residual alone is not evidence of a nonzero extension obstruction.
