The active coefficient degree decides the stabilizer

$A = \mathrm{diag}(1, \zeta, \zeta^2)$

e1	0
e2	0
e3	1

Active degree: {3}
Stabilizer: all μ_3

$C = \mathrm{diag}(1, 1, \zeta)$

e1	$2 + \zeta$
e2	$1 + 2\zeta$
e3	ζ

Active degree includes 1
Stabilizer: identity only
