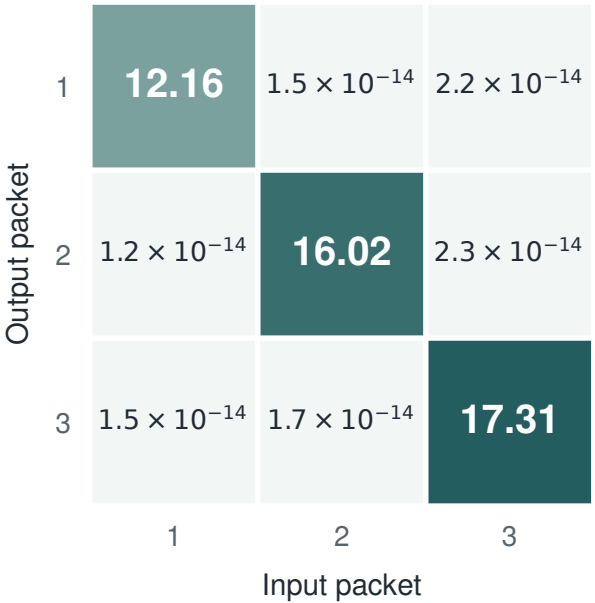
Projector products after a change of basis

Each entry is $\|Q_i Q_j\|_F$ for transported coordinate projectors.



The exact identities

$$Q_i = U P_i U^{-1}$$

$$Q_i^2 = Q_i$$

$$Q_i Q_j = 0 \quad (i \neq j)$$

The diagonal can have large norms.
Small off diagonal values are roundoff.

Three packets of dimension 4 in a space of dimension 12. This is a numerical illustration.
