Holonomy obstruction resolved by packets

Complete projectors resolve both input and output. Off diagonal blocks record mixing.

Reconstruction and detection

$$\mathrm{Ob} = H - \mathrm{id}$$

$$\mathrm{Ob}^{\mu\nu} = \Pi_\mu \mathrm{Ob} \Pi_\nu$$

$$\mathrm{Ob} = \sum_{\mu,\,\nu} \mathrm{Ob}^{\mu\nu}$$

If $\mathrm{Ob}^{13} \neq 0$: an input in packet 3 has a nonzero output in packet 1.

All blocks vanish if and only if the total obstruction vanishes.

The highlighted block is a conditional mixing witness. Shading does not assign numerical block values.
