One rational parameter retains three power conditions

positive $v(t)$	positive $v(1-t)$	shared denominator
$v(t) = 3a$ $v(1-t) = 0$	$v(t) = 0$ $v(1-t) = 5b$	$v(t) = v(1-t)$ $= -7c$

$$t = A^3/C^7 \quad \text{and} \quad 1-t = B^5/C^7$$

Enforce each valuation condition at its active primes
a, b, c are positive integers in their active sectors
