A left-null basis evaluates the canonical affine obstruction

$A\,z = t(p_0)$
15 equations
10 parameters

$N\,A = 0$
N has 7 or 8 rows

$$\text{Stage P is solvable} \Leftrightarrow N\,t(p_0) = 0$$

Actual $t(p_0)$ and $N\,t(p_0)$ have not been computed
The finite matrices do not supply their arithmetic origin
