OPERATION KOMOREBI · REALIZATION CALCULUS

Projector Resolved Seed Calculus III

Release scope and verification record

Version 1.0.0-rc1 · 20 October 2026 · Private prepublication candidate

Publication decision

Technical package assembled and source identities authenticated. Unrestricted formal closeout is not certified. The expanded manuscript is supplied in full, with the historical Lean formal core and the Section 16 continuation. Section 17 gains a new full ordinary proof supplement. Two candidate Lean modules remain uncompiled and are not imported into the accepted development.

What the evidence supports

Layer	Accepted boundary
Finite algebraic core	Historical 41-row formal map and 143 mapped targets, retained with its original evidence.
Section 16	12 recorded production modules, with 558 logical declarations replayed in the inherited record; 14 generated runtime helpers separately inventoried.
Section 17	Ordinary proofs of continuous packet jets, norm estimates, Taylor remainders, and higher composition. No new Lean acceptance.
Independent tests	15,331 retained Section 16 controls, 2,622 Section 17 controls, and 677 new higher-order symbolic checks passed in this closeout.

Critical restriction

The 16 October visual edition asserts 2,693 replayed declarations and 98+2 accepted results. Its matching Lean source and independent receipts were not recovered. Those claims are **not** release certified here. The 8 October visual guide is the selected reproducible edition.

Licensing and distribution

No project-wide manuscript or code license was selected in the preserved materials. This package is a private release candidate, not permission for public redistribution. No license has been inferred or assigned.

Evidence guide and reading order

A bounded, reproducible reading edition

What each document is

Traditional monograph (98 pages). The complete October 8 mathematical edition, unchanged. It includes established theorems, qualified reductions, research directions, and ordinary proofs across the expanded paper.

Analytic proof supplement (5 pages). Additional rigorous Section 17 arguments. In particular, the literal range jet has a sharper norm bound than its ambient extension. No new Lean result is claimed.

Visual guide (26 pages). The source-bound finite companion, with 24 worked plates and 22 exact model figures. This is the earlier edition, deliberately selected over an October 16 edition with unauthenticated formal claims.

Lean and evidence guide (49 pages). Documents the historical finite 41-row contract. It is preserved, not silently retrofitted to claim expanded monograph coverage.

Statement register (167 environments). The JSON and CSV map identifies source hashes and evidence classes, including 98 theorem-like environments and two classical standard-fact environments.

Reproducibility

Run `python VERIFY_RELEASE.py` after extraction to validate all packaged bytes and PDF structure. The exact symbolic tests and inherited proof source/object identity checks have separate commands in the release README. Fresh Lean kernel verification requires the absent pinned 2.9 GB toolchain and dependencies.

What remains open

The two Section 17 draft Lean modules, the analytic derivative API correspondence, exact higher-order formalization, and comprehensive Lean correspondence for the expanded manuscript. The public license decision also remains outstanding. An accepted historical proof transcript is not a new compilation in this environment.

Interpretation

The mathematical language of packet reconstruction and obstruction is usable now. Closing a narrowly stated theorem and proving general existence are different achievements. This release preserves that distinction, including all known failures and unrecovered evidence.
