Resolution Theory: Galois Expanded Journal Edition

Language Model Contribution Disclosure

Komorebi P.

An OpenAI language model assisted with consolidation of earlier Resolution Theory editions, theorem migration, proof comparison, formulation of the metric and stability section, organization of weighted packet inverse results, extension of the countable and nonlinear sections, formulation and auditing of the Galois embedding, ramification resolution, profinite projector, Hilbert 90, Brauer obstruction, and Tannakian boundary sections, source auditing, preparation of vector figures, construction of deterministic verification code, and journal formatting.

The mathematical claims, definitions, hypotheses, proofs, examples, citations, and judgments of novelty require independent verification by the author and specialist reviewers. The author is responsible for every statement in any submitted version. The language model is not an author.
